

1. An auction information provision system for use in an electronic auction, comprising:

an exhibitter terminal for searching said purchaser's information and for inputting exhibitter's information of exhibited goods for registration, said exhibitter's information being inputted when said exhibited goods comply with said purchaser's information;

a network through which said purchaser terminal and said exhibitor terminal are connected with said auction management server;

said auction management server noticing said purchaser terminal that goods complying with said purchaser's information are exhibited in said electronic auction, when exhibited goods corresponding to said purchaser's information are registered as said

exhibitor's information from said exhibitor terminal.

2. An auction information provision system as claimed in claim 1, wherein said purchaser's information of desired goods are transmitted by electronic mail (E-mail) from the purchaser to said auction management server, when said purchaser's information of desired goods are previously registered therein.

3. An auction information provision system as claimed in claim 1, wherein said purchaser's information of desired goods are transmitted by telephone call from the purchaser to said auction management server, when said purchaser's information of desired goods are previously registered therein.

4. An auction information provision system as claimed in claim 1, wherein said purchaser's information of desired goods are transmitted by mail from the purchaser to said auction management server, when said purchaser's information of desired goods are previously registered therein.

5. An auction information provision system as claimed in claim 2, wherein said purchaser is identified for distinction from the other purchasers by E-mail address of said purchaser.

6. An auction information provision system as claimed in claim 3, wherein said purchaser is identified for distinction from the other purchasers by telephone numbers of said purchaser.

5

7. An auction information provision system as claimed in claim 4, wherein said purchaser is identified for distinction from the other purchasers by address of said purchaser.

5

8. A method of providing auction information for use in an electronic auction, said method comprising the steps of:

previously registering purchaser's information of desired goods on an auction management server through a network;

supplying said purchaser's information over said network;

searching said purchaser's information through said network and registering exhibitor's information of exhibited goods on said auction management server through said network, said exhibitor's information being registered when said exhibited goods comply with said purchaser's information in said searching step; and

noticing that goods complying with said purchaser's information are exhibited in said electronic auction, when exhibited goods corresponding to said purchaser's

T-01120-0525060

information are registered as said exhibitter ' s
20 information.
